Digital Bhem

WE MAKE WEBSITES THAT MAKE MONEY

A warm welcome to Digital Bhem 👋

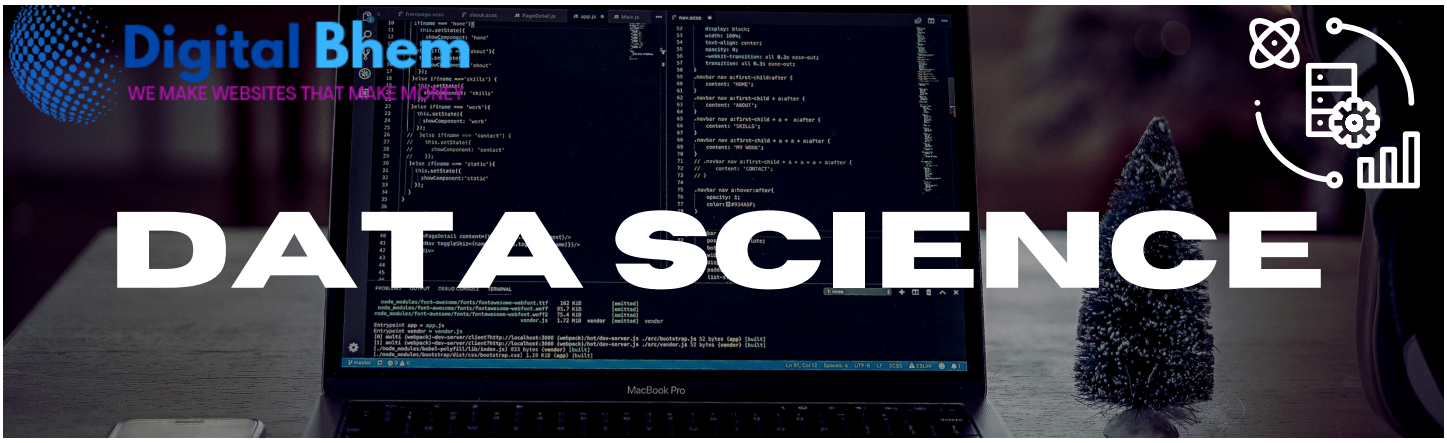
We're very excited to have you here! We hope you enjoy 3 Month Internship Program.

INSTRUCTIONS :

1. LinkedIn profile improvement (Mandatory).
2. For this internship you will need to complete Tasks as per your convenience for successful completion of internship.
3. Maintain a separate GitHub repository(name as **DIGIBHEM** for all the tasks and share the link of the GitHub repo in the task submission form(it will be given later through email).
4. You can refer to online resources such as Google Search and read tutorials, Watch videos(For Help).

SUBMISSION

1. A **TASK SUBMISSION FORM** will be shared later. Till then please continue your task.
2. A video need to be created to showcase your work, demo of your effort.(After Task Completion)
3. The video can be hosted on LinkedIn for proof of your work and build credibility among your peers . You can tag Digital Bhem in such posts.
4. Please add **#digitalbhem** in each of your task video postings on LinkedIn, Additionally, you can also add hashtags such as #internship #webdevelopment, #androiddevelopment, #pythonprogramming etc. depending on your internship domain for more reach and visibility.



Project - 1

MOVIE BOX OFFICE PREDICTION

Overview

The goal of this project is to predict movie box office earnings based on features like cast, genre, and budget. This could be useful for a variety of purposes, such as helping studios make decisions about which movies to produce, or helping investors decide which movies to invest in.

Free Resources

- **Dataset:** The Movie Lens dataset is a free dataset of movie ratings and other information, including box office earnings. It can be downloaded from this link: https://grouplens.org/datasets/movielens/.
- **Machine learning libraries:** There are a number of free machine learning libraries available, such as scikit-learn and Tensor Flow. These libraries can be used to train and deploy machine learning models.

Methodology

The following steps will be used to predict movie box office earnings:

1. **Data preparation:** The Movie Lens dataset will be cleaned and preprocessed. This may involve removing outliers, imputing missing values, and converting categorical data to numerical data.
2. **Feature engineering:** New features will be created from the existing data. For example, we could create features that capture the popularity of the cast, the genre, and the budget.
3. **Model selection:** A machine learning model will be selected to predict movie box office earnings. Popular models for this task include linear regression, support vector machines, and random forests.
4. **Model training:** The selected model will be trained on the prepared data.
5. **Model evaluation:** The trained model will be evaluated on a held-out test set.
6. **Model deployment:** The trained model will be deployed to production so that it can be used to predict movie box office earnings for new movies.

Conclusion

This project has the potential to make a significant contribution to the movie industry. By developing a machine learning model that can accurately predict movie box office earnings, we can help studios make better decisions about which movies to produce, and help investors make better decisions about which movies to invest in.
